

Package: pollimetry (via r-universe)

September 13, 2024

Type Package

Title Estimate Pollinator Body Size and Co-Varying Ecological Traits

Version 1.1.0

Date 2022-06-20

Maintainer Liam Kendall <liam.k.kendall@gmail.com>

Description Tools to estimate pollinator body size and co-varying traits. This package contains novel Bayesian predictive models of pollinator body size (for bees and hoverflies) and bee foraging range, as well as preexisting predictive models for pollinator body size (currently implemented for ants, bees, butterflies, flies, moths and wasps), bee tongue length, foraging range, total field nectar loads and wing loading. An additional GitHub repository <<https://github.com/liamkendall/pollimetrydata>> provides model objects to use the bodysize and foraging.range functions internally. All models are described in Kendall et al. (2019) <[doi:10.1002/ece3.4835](https://doi.org/10.1002/ece3.4835)> & Kendall et al. (2022) <[doi:TBC](#)>.

Depends R (>= 4.0.0), brms (>= 2.16.1)

Imports stats, repmis, stringr, dplyr, lifecycle

Suggests pollimetrydata

License GPL (>= 2)

LazyData true

RoxygenNote 7.2.0

Encoding UTF-8

bodysize	<i>Converts the intertegular distance (ITD) and co-variates to body size in dry weight (mg) for bees or hoverflies.</i>
-----------------	---

Description

Calculates body size in dry weight (mg) from Kendall et al. (2018) using ITD (and co-variate) values.

Usage

```
bodysize(x, taxa, type)
```

Arguments

- x A data frame with columns containing 'ITD' values and Sex ('Male' or 'Female'). Optional attributes depending on model choice: Taxonomy ('Family' for bees or 'Subfamily' for hoverflies), 'Region' (Currently only "NorthAmerica", "SouthAmerica", "Australasia" and "Europe" implemented) and 'Species' ("Genus_species" format). Non-implemented regions and/or species are acceptable. See details.
- taxa A vector specifying insect taxa of interest, can be either "bee" for bee models and "hov" for hoverfly models
- type A vector specifying model type to be used: for bees this can be either "taxo" for the full taxonomic model, "phy" for the full phylogenetic model, "sex" for the reduced sexual dimorphic model or "ITD" for the ITD-only model. In hoverflies: this can either be "taxo" for the full taxonomic model, "sex" for the reduced sexual dimorphic model or "ITD" for the ITD-only model.

Details

For bees, type option 'taxo' requires ITD, sex and taxonomic family. Type option 'phylo' only requires ITD and Sex to run but should be only be used for with Species (and Region) included in model formulation n.b. the function checks for contained species.

For hoverflies, type 'taxo' requires ITD, Subfamily and Sex for each specimen. Type "ITD" for both taxa only requires ITD values (Optional: region and species but check 'setdiff'). If specimens are from included regions or species (see above) we recommend including these as additional columns. Estimates (and variance components) are returned as four additional columns bound to the original dataframe. In the likely case that non-represented taxa and regions are included in inputted datasets, 'allow_new_levels' is set to true for all models. Estimates will then be modelled with group-level uncertainty in the predictions based on the variation of the existing levels. This function makes use of external model objects hosted on GitHub. In the case of slow loading, we recommend you download the pollimetrydata package from <https://github.com/liamkendall/pollimetrydata>.

Value

The original dataframe (x) along with additional columns of body size, and 90

References

- Kendall et al. (2019) Pollinator size and its consequences: Robust estimates of body size in pollinating insects. *Ecology and Evolution*, 9(4), 1702-1714. doi:[10.1002/ece3.4835](https://doi.org/10.1002/ece3.4835).

Examples

```
ITD=c(1.3,2.3)
Sex=c("Female","Male")
Subfamily=c("Syrphinae","Eristalinae")
Region=c("Australasia","Europe")
Species=c("Sphaerophoria_macrogaster","Myathropa_florea")
example.data <- data.frame(ITD,Sex,Subfamily,Region,Species)
bodysize(x=example.data,taxa="hov",type="taxo")
```

foragedist

(*Deprecated*) Converts body weight to measures of foraging range for bees.

Description

'r lifecycle::badge("deprecated")` This function is now deprecated and has been superceded by 'foraging.range'

Calculates foraging range from Greenleaf et al. (2007) using intertegular distance (ITD) values, van Nieuwstadt and Iraheta (1996) using head width (HW) values for Meliponini (stingless bees) and Guedot et al. (2009) using dry weight (mg) values for Osmia species.

Usage

```
foragedist(x, type = "GreenleafAll")
```

Arguments

x	A vector of either bee intertegular spans (IT) measurements in mm, head width values in mm or dry weight values (mg).
type	The type of foraging range desired. Options are "GreenleafAll", GrMhd ("Maximum homing distance"), GrThd ("Typical homing distance"), GrMfd ("Maximum feeder training distance"), GrMcD("Maximum communication distance"), "Osmia", "MeliMR" , "MeliFT" or "MeliAll". See details in Greenleaf et al. (2007), Guedot et al. (2009) and van Nieuwstadt and Iraheta (1996).

Value

A dataframe with bee and foraging range (km) is returned for each bee species.

Examples

```
foragedist(c(10,5,2), type = "MeliMR")
```

forage_dataset

Bee foraging range measurements for 101 bee species.

Description

A dataset containing measurements of foraging range (m), intertegular distance (mm), sociality and metadata for 101 bee species (425 estimates).

Usage

```
forage_dataset
```

Format

An object of class `data.frame` with 425 rows and 20 columns.

References

- Kendall et al. (2022). Sociality and body size determine the potential and realized foraging ranges of bees. [TBC.#'](#)

<code>foraging.range</code>	<i>Predict foraging range for bees using intertegular distance and degree of sociality</i>
-----------------------------	--

Description

Calculates realized (or potential) foraging range from Kendall et al. (2022) using intertegular distance (ITD) values and degree of sociality (highly eusocial, primitively eusocial or solitary).

Usage

```
foraging.range(
  data,
  model.type = "social",
  random.effects = "reduced",
  measure.type = "realized"
)
```

Arguments

<code>data</code>	A dataframe containing between two to four columns: bee intertegular distance (ITD) measurements in mm, species (Format: "Genus_species") and sociality (Format: "Highly Eusocial", "Primitively Eusocial", "Solitary").
<code>model.type</code>	A string stating which model should be used: "social", for the model that includes sociality, body size (ITD) and measurement type, or "ITD", for the reduced model that only includes body size and measurement type.
<code>random.effects</code>	A sting stating if random effects are to be used using predictive purposes. Options are 1) phylogenetic effect and species effects "full", 2) only phylogenetic effect ("phylo"), or 3) fixed effects only ("reduced"). Default is "reduced".
<code>measure.type</code>	A string stating whether to return realized ("realized") or potential ("potential") estimates.

Value

A dataframe with bee foraging range (km) is returned for each bee species (row).

References

- Kendall et al. (2022) The potential and realized foraging movements of bees are differentially determined by body size and sociality *Ecology* TBC.

Examples

```
ITD=c(2.9,2.9,2.9)
species=c("Apis_mellifera","Osmia_cornifrons","Bombus_bifarius")
sociality=c("Highly Eusocial","Solitary","Primitively Eusocial")
example.data <- data.frame(ITD,species,sociality)
foraging.range(example.data,random.effects = "full",measure.type = "realized")
```

headwidthsize	<i>Converts pollinator (Diptera, Hymenoptera and Lepidoptera) head width (mm) to body size (dry weight (mg)).</i>
---------------	---

Description

Calculates dry body weight (mg) using head width (mm) from Hodar (1997).

Usage

```
headwidthsize(HW, Eq = "H97DB")
```

Arguments

HW	A vector of head width measurements (mm).
Eq	a vector of predictive allometries for insect taxa from Hodar (1997). Options implemented are: H97DB (Brachycera), H97DN (Nematocera), H97HA (Hymenoptera), H97LH (Heterocera) and H97LR (Rhopalocera).

Value

A dataframe with pollinator body size as dry weight (mg) is returned for each specimen from selected equation.

References

- Kendall et al. (2019) Pollinator size and its consequences: Robust estimates of body size in pollinating insects. *Ecology and Evolution*, 9(4), 1702-1714. doi:[10.1002/ece3.4835](https://doi.org/10.1002/ece3.4835).
- Hodar, J. A. (1997). The use of regression equations for the estimation of prey length and biomass in diet studies of insectivore vertebrates. *Miscellania Zoologica*, 20(2), 1-10.

Examples

```
headwidthsize(HW=c(10,5,2), Eq = c("H97DB"))
```

lengthsize	<i>Converts body length to body size (body weight (mg)) for three pollinating insect groups (Diptera, Hymenoptera and Lepidoptera).</i>
------------	---

Description

Calculates body size as dry weight (mg) from existing allometries (See 'Details') using body length values (mm).

Usage

```
lengthsize(BL, Eq = "DIP")
```

Arguments

BL	A vector of pollinator body length (BL) measurements (mm).
Eq	A vector specifying which predictive allometry to use. Acronyms denote first (and second author), publication date and taxon. DIP, HYM and LEP options are cases where authors modelled body size across all specimens within each order. Options implemented are:

Diptera

- All: BN06D, G97D, GR84D, JS00DA, R77D, S80DCF, S80DCR, S80DMF, S93DA, W13D.
- Brachycera (2 equations): S93DB, Sabo02DB.
- Nematocera (3 equations): JS00DN, S93DN, Sabo02DN.
- Asilidae (2 equations): Sabo02DA, S93DB.
- Bombyliidae (2 equations): S93DB, Sabo02DBB.
- Cyclorrhapha: S93DC.

Hymenoptera

- All: BN06H1, G97H, G97F, GR84H, JS00HA, R77H, S80HCF, S80HCR, S80HMF, S93HA, Sabo02H, W13H.
- Formicidae (13 equations): BN06HF, GR84F, JS00HF, R77A, S80FCF, S80FCR, S80FMF, S93HF, S93HH, S93HI, BN06H1, G97H, G97F.
- Apidae: Sabo02HA.
- Braconidae: S93HB.
- Halictidae: S93HH.
- Ichneumonidae: S93HI.
- Pompilidae: S93HP.
- Vespidae: S93HV & Sabo02HV.

Lepidoptera

- All: BN06L, G97L, JS00L, R77L, S80LCF, S80LCR, S80LMF, S93LA, W13L.
- Noctuidea: S93LC, S93LN.

- Geometridae: S93LG.
- Microlepidoptera: S93LM.
- Arctiinae: S93LC.

Value

A dataframe with pollinator body size (mg) is returned for each species from selected equation/s.

References

Full reference list provided within Kendall et al. (2019) Pollinator size and its consequences: Robust estimates of body size in pollinating insects. *Ecology and Evolution*, 9(4), 1702-1714. doi:10.1002/ece3.4835.

Examples

```
lengthwidthsize(BL=c(10,5,2), Eq = c("S80DCR"))
```

<code>lengthwidthsize</code>	<i>Converts pollinator body length*body width to body size (dry weight (mg)).</i>
------------------------------	---

Description

Calculates body size as dry weight (mg) from the equations described by Sample (1993) and others using body length*body width values (mm).

Usage

```
lengthwidthsize(BLW, Eq = "DIP")
```

Arguments

<code>BLW</code>	A vector of fly body length*body width measurements (mm).
<code>Eq</code>	a vector of a predictive allometry for Diptera, Hymenoptera or Lepidoptera. Options implemented are:

Value

A dataframe with body size, as dry weight (mg) is returned for each specimen from selected equation.

- Kendall et al. (2019) Pollinator size and its consequences: Robust estimates of body size in pollinating insects. *Ecology and Evolution*, 9(4), 1702-1714. doi:10.1002/ece3.4835.
- Sample et al. (1993) Estimation of insect biomass by length and width. *American Midland Naturalist*, 234-240.

Examples

```
lengthwidthsize(BLW=c(3,5,2), Eq = c("Brachycera"))
```

Melin_et_al_2019

Bee tongue length measurements for 11 Melittidae bee species.

Description

A dataset containing glossa (mm), prementum (mm) and proboscis (mm) and taxonomic information for 179 measured bee specimens.

Usage

```
Melin_et_al_2019
```

Format

An object of class `data.frame` with 179 rows and 7 columns.

Details

@references

- Melin et al. (2019) The allometry of proboscis length in Melittidae (Hymenoptera: Apoidae) and an estimate of their foraging distance using museum specimens. *PLoS one*, 14(6), e0217839. doi:10.1371/journal.pone.0217839.

nectarload

Converts bee body length (mm) to total field nectar load (ul).

Description

Calculates total field nectar load (ul) using body length (mm) from Henry & Rodet (2008).

Usage

```
nectarload(BL)
```

Arguments

BL	vector of body length measurements (mm).
----	--

Value

A dataframe with bee total field nectar load (ul) is returned for each specimen.

References

- Kendall et al. (2019) Pollinator size and its consequences: Robust estimates of body size in pollinating insects. *Ecology and Evolution*, 9(4), 1702-1714. [doi:10.1002/ece3.4835](https://doi.org/10.1002/ece3.4835).

Examples

```
nectarload(BL=c(10,5,2))
```

pollimetry_dataset	<i>Body size and intertegular distance measurements of 4438 pollinating insect specimens.</i>
--------------------	---

Description

A dataset containing the body size in dry weight (mg), intertegular distance (mm), body length (mg) and metadata for 4438 measured bee and hoverfly specimens.

Usage

```
pollimetry_dataset
```

Format

An object of class `data.frame` with 4434 rows and 23 columns.

Details

@references

- Kendall et al. (2019) Pollinator size and its consequences: Robust estimates of body size in pollinating insects. *Ecology and Evolution*, 9(4), 1702-1714. [doi:10.1002/ece3.4835](https://doi.org/10.1002/ece3.4835).

tonguelength	<i>Converts ITD (mm) to tongue length for bees.</i>
--------------	---

Description

Calculates tongue length (mm) from Cariveau et al. (2015) and Melin et al. (2019) using intertegular distance (ITD) values (mm).

Usage

```
tonguelength(x, mouthpart = "all")
```

Arguments

- x A dataframe with the following two columns: bee intertegular distance (IT) measurements in mm and family, a vector of bee families. Only six out of the extant seven families are implemented: "Andrenidae", "Apidae", "Colletidae", "Halictidae", "Melittidae" and "Megachilidae".
- mouthpart The mouthpart you are interested in. Options are: "all", "glossa", "prementum" and "tongue" (i.e. gloss + prementum)

Value

A dataframe with bee tongue length (mm) and 95

References

- Kendall et al. (2019) Pollinator size and its consequences: Robust estimates of body size in pollinating insects. *Ecology and Evolution*, 9(4), 1702-1714. doi:[10.1002/ece3.4835](https://doi.org/10.1002/ece3.4835).

Examples

```
example=cbind.data.frame(IT=c(1.3,2.3),
                         Family=c("Andrenidae","Apidae"))
tonguelength(example,mouthpart="all")
```

wingloading

Converts intertegular distance (mm) to wing loading (mg mm²).

Description

Calculates wing loading (mg mm²) expressed as dry weight per total wing area using intertegular distance (mm) from Bullock (1999).

Usage

```
wingloading(IT)
```

Arguments

- | | |
|----|--|
| IT | vector of intertegular distance measurements (mm). |
|----|--|

Value

A dataframe with wing loading (mg mm²) is returned for each specimen.
